

Georgia Energy Storage Peak-Valley Arbitrage Program

Overview

Energy storage is an effective way to facilitate renewable energy (RE) development. Its technical performance and economic performance are key factors for large scale applications. As battery en.

What is Peak-Valley arbitrage?

The peak-valley arbitrage is the main profit mode of distributed energy storage system at the user side (Zhao et al., 2022). The peak-valley price ratio adopted in domestic and foreign time-of-use electricity price is mostly 3–6 times, and even reach 8–10 times in emergency cases.

How does reserve capacity affect peak-valley arbitrage income?

However, when the proportion of reserve capacity continues to increase, the increase of reactive power compensation income is not obvious and the active output of converter is limited, which reduces the income of peak-valley arbitrage and thus the overall income is decreased.

Does energy storage generate revenue?

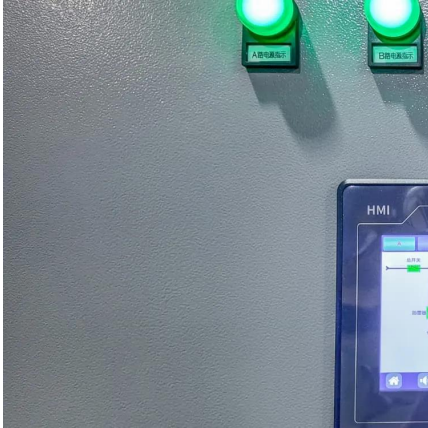

Techno-economic analysis of energy storage with wind generation was analyzed. Revenue of energy storage includes energy arbitrage and ancillary services. The multi-objective genetic algorithm (GA) based on roulette method was employed. Both optimization capacity and operation strategy were simulated for maximum revenue.

When is energy storage charged & discharged?

Usually, the energy storage is charged at night when the price is at valley stage, and discharges during the daytime when the power consumption is at peak, so as to achieve peak-valley arbitrage and save cost.
