Outdoor base station classification

Overview

What are the different types of base station antennas?

Here are some common types of base station antennas: - Omnidirectional antennas: These antennas radiate equally in all directions in the horizontal plane. They are used for providing coverage in a circular area around the antenna. Omnidirectional antennas have low gain and are suitable for low-density or rural areas.

What is a transportable base station?

Due to the characteristics of size and ability to operate in hostile environmental conditions that we have reviewed in outdoor base stations, transportable base stations are ideal for installation in vehicles or, in general, to be used in mobility environments by incorporating transport accessories.

What is an outdoor compact base station?

Outdoor compact base stations These base stations are designed for installation in any type of outdoor scenario. They offer a high degree of IP protection, which allows them to operate in the most adverse conditions (rain, extreme heat, wind, humidity, saline environments.) without requiring an additional mechanical cover.

What is a base station antenna?

Base station antennas are devices that transmit and receive radio signals for wireless communication networks. They are usually mounted on towers, buildings, or other structures to provide coverage for a certain area. There are different types of base station antennas depending on the frequency band, polarization, radiation pattern, and gain.

Outdoor base station classification

Base Station Class

The RF requirements define the receiver and transmitter RF characteristics of a base station or UE. The base station is the physical node that transmits and receives RF signals on one or ...
