

# Single-axis solar automatic tracking system

## Overview

---

What is a single axis solar tracking system?

Kiyak and Gol developed a single-axis solar tracking system based on both fuzzy logic and a Proportional Integral Derivative (PID) controller using an Atmel microcontroller. According to the angle of solar energy, a solar panel is oriented to the side where light intensity is greatest by being designed for the related supervisory controllers.

What are the advantages of a single axis solar tracker system?

This design of a sun sensor tracker system with a single-axis tracker has several advantages, such as real-time detection, the accuracy of tracking the sunlight direction, the lower cost of the solar tracker system, its ease of implementation, and its application in different arrangements of the solar panel array system.

How does a single axis sun sensor tracker work?

The PV system with a single-axis sun sensor tracker moves the solar panel from the east to west direction following the sunlight. Therefore, the output electric power of the solar panel is increased compared to the output electric power of a fixed-structure PV system.

How much does a single axis solar tracker cost?

The cost of single-axis solar trackers is a significant factor when considering their purchase. The cost varies widely depending on the size and type of the tracker and the manufacturer. The average price of a single-axis solar tracker is \$2,000 to \$5,000 or more per tracking system for a residential installation.
