

# Solar 63 kW solar panels with what size inverter

## Overview

---

How big should a solar inverter be?

To account for power losses assume an 80 percent efficiency. Your solar inverter should have a similar or slightly higher wattage rating than the DC output of your solar panels (which in this case is 4.5 kW). You can size it between 1.15 and 1.5 times larger. The rule of thumb is to size your inverter 1.25 bigger than your solar array.

What is the difference between kW and KVA in a solar inverter?

Solar inverters are measured in kVA (kilo-volt-amperes), which is a measure of apparent power, while kW is a measure of actual power. In a 100% efficient system, kW and kVA are the same. Solar inverters are available in various sizes. Residential solar inverter sizes typically range from 1 kW to 10 kW, depending on the home's energy needs.

How many kilowatts can a solar inverter handle?

For example, a 5kW inverter is designed to handle up to 5 kilowatts of continuous power coming from your solar panels. If your solar array generates more than the inverter's rated capacity during peak sunlight hours, the inverter won't be able to process all of it—some energy will be clipped or lost.

How much wattage does a solar inverter need?

A good rule of thumb is to multiply the total wattage of your solar panels by 1.25 to account for inefficiencies and potential load spikes. For example, if you have a 5 kW solar system, you would need an inverter rated for at least 6.25 kW. Q: What happens if my inverter is too small for my solar panel system?

## Solar 63 kW solar panels with what size inverter

---

### [How To Size A Solar Inverter in 3 Easy Steps](#)

Our Inverter Size Calculator simplifies this task by accurately estimating the recommended inverter capacity based on your solar panel power and quantity. By inputting your panel's rated power and number of ...
