

Solar and glass

Overview

What is solar glass?

Solar glass is a type of glass that is specially designed to harness solar energy and convert it into electricity. It is made by incorporating photovoltaic cells into the glass, allowing it to generate power from sunlight. This innovative technology has gained popularity in recent years as a sustainable and efficient way to produce clean energy.

Why is glass important for solar energy?

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass mitigates these losses by functioning as a protective layer, optical enhancer, and spectral converter within PV cells.

What is Photovoltaic Glass?

Photovoltaic glass represents the natural evolution of solar energy: a smart, aesthetic, and efficient way to generate electricity from the very structures that surround you. You no longer have to choose between design and sustainability—with this technology, you can have both.

How does Photovoltaic Glass work?

Photovoltaic glass operates on the same basic principle as any solar system: it converts sunlight into electricity. It uses solar cells made of materials such as amorphous silicon, crystalline silicon, or advanced thin-film technologies. These cells are encapsulated between layers of glass, making the product durable, safe, and functional.
