

Solar shingled cells are n-type cells

Overview

What is a shingled cell?

A shingled cell consists of regular cells laser cut into strips, then overlaid like shingles on a roof. Rather than relying on metal busbars for electricity flow, the silicon strips are joined together using an electrically conductive adhesive (ECA). This allows conductivity, but also flexibility and resistance against micro-cracks.

What is a shingled solar module?

With the shingled layout, there are fewer gaps between the individual solar cells so more of the sunlight that is incident on the module can be absorbed. Instead of using external connectors to transport the current from one cell to the next, the area of the cell overlap is used as an electrical connector.

Are shingled solar cells better than conventional solar cells?

According to various static and dynamic tests of mechanical loading, the shingled solar cell approach is more resistant to failure caused by external forces being applied to the panel when compared to conventional solar cells.

Are shingled solar panels a structural component?

On the other hand, shingled solar panels do not act as a structural component of your roof. The interconnection of this technology consists of cutting solar cells into a certain number of strips which are overlaid by connecting their edges using an electrically conductive adhesive (ECA).

Solar shingled cells are n-type cells

Shingle Solar Cells and Modules

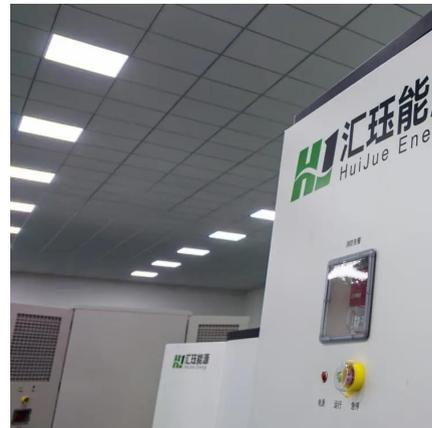

In addition, shingled solar cells reflect less light, and thus generate more electricity. The adaptation of solar cell production from the conventional approach to shingled solar cells ...
