# Sound insulation under solar glass

## Overview

---

How does insulated glass help with sound insulation?

Insulated glass is an ideal window and door material which significantly helps in counteracting noise pollution. The presence of air space or gas-filled cavity in between two panes of glass provides better sound insulation.

Is solarlux a good sound insulation system?

This is suitable when there are particularly high sound insulation or wind load requirements – for example, on busy roads or in high-rise buildings. In terms of sound insulation, Solarlux offers an  $R_w$  value of around 30 dB in the highest configuration level, thus exceeding the performance of predecessor systems.

Is thicker glass better for sound insulation?

The thicker the glass, the better the sound insulation properties. The further the sound has to travel through the glass, the more sound waves will drop off. Thicker glass is a common solution to reduce low frequency sounds like common traffic and neighbourhood noise. It is especially effective when combined with double glazing.

Which glass elements can be used for sound insulation?

If even higher sound insulation values are required –for example in the immediate vicinity of airports or railway lines– glass elements with surrounding aluminium profiles can be used. These are available for all glass thicknesses, including for both Proline T versions.

## Sound insulation under solar glass

### Sound Insulation Theory

Insulated Glass Units: Sound reflections within the IGU create reverberations reducing the sound insulation effect of using 2 panes. For IGUs to be effective air-gap should ...
