

# The difference between solar silicon wafers and glass wafers

## Overview

---

What are solar wafers?

Solar wafers are a unit of semiconductor substances shaped like a fragile disc and made of silicon. They're one of the most prevalent semiconductors in use today. Silicon-based PV cells and electronic integrated circuits (ICs) are made from these wafers. The wafer acts as the foundation of PV designs.

What is the difference between glass and silicon wafers?

With a density of 2.3290 g/cm<sup>3</sup>, silicon offers marginally higher density than most common glass wafers. Consequently, silicon wafers have slightly greater weight than same-sized glass wafers although only by single digit percentages.

Do solar panels use wafers?

P-type (positive) and N-type (negative) wafers are manufactured and combined in a solar cell to convert sunlight into electricity using the photovoltaic effect. Thin-film solar panels do not use wafers but are highly inefficient and only used in rare circumstances. Over 90% of solar panels use silicon wafers.

Are silicon wafer-based solar cells the future of photovoltaic technology?

Silicon wafer-based solar cells have long been the industry standard in photovoltaic applications worldwide. That's unlikely to change anytime soon. Research and innovation are always ongoing but primarily focused on improving silicon wafer technology — not replacing it.

## The difference between solar silicon wafers and glass wafers

### [Glass Wafer vs Silicon Wafer: An In-Depth ...](#)
