

# What inverter to use for solar lights

## Overview

---

What is a solar inverter?

Solar inverters are the heart of any solar energy system, converting the direct current (DC) electricity generated by solar panels into alternating current (AC) power for homes, businesses, or utility grids.

What type of solar inverter do I Need?

**String Inverters:** The most common type for residential solar systems. This inverter connects multiple solar panels to a single unit, and if one panel fails, it doesn't affect the entire system's efficiency. It's the ideal choice for most residential users.

How do inverters work in a rooftop solar system?

The electricity produced by solar panels is initially a direct current (DC). Inverters change the raw DC power into AC power so your lamp can use it to light up the room. Inverters are incredibly important pieces of equipment in a rooftop solar system. There are three options available: string inverters, microinverters, and power optimizers.

What are the different types of solar inverters?

For instance, a microinverter system can increase energy output by up to 25% in partially shaded areas. String inverters connect a series (or "string") of panels to a single inverter. These are the most common type used in residential and commercial solar systems.
